

## Digital Investigations

Published on Alvarez & Marsal (<https://www.alvarezandmarsal.com>)

Increasing amounts of information stored on electronic devices, e-mail application systems and cloud-based data repositories has forever changed the way data sources are considered at the start of an investigation. We help our clients efficiently identify, collect and present reliable facts and evidence from complex information technology (IT) environments to the court.

Our analysis stretches beyond live emails and documents to encompass deleted files and internet activity that can help identify relevant facts, in a legally defensible, manner for a wide range of matters including fraud, misuse of computers, cartel activity, bribery and corruption, and theft of intellectual property.

Our global team has presented evidence in national courts around the world as well as various arbitration venues. We regularly assist with the execution of civil search orders and ensure that our investigations comply with the local guidelines on digital evidence.
